Apple-1, Apple, US, 1976

Steve Wozniak debuted the prototype Apple-1 at the Homebrew Computer Club in 1976. For \$666.66, buyers received a simple single-board computer with 4K of RAM. A cassette-based BASIC programming language simplified interaction though users had to add a power supply, keyboard, storage system, and display to build a fully-functioning system.

Speed: 1 MHz Memory size: 4K Memory type: Semiconductor Memory width: 8-bit Cost: \$666.66

Apple II, Apple, US, 1977

Steve Wozniak designed the Apple II in 1977. The self-contained unit housed electronics, keyboard, and power supply, with the BASIC language in permanent memory. A TV served as display. The floppy disk drive (1978) and spreadsheet program VisiCalc (1979) made it a blockbuster.

Speed: 1 MHz Memory size: 4K Memory type: Semiconductor Memory width: 8-bit Cost: \$1,298
